Today Work Update – AP RERA Project (Quarterly Updates Module)

Today I worked on enhancing the **Quarterly Updates module** in the AP RERA application, focusing mainly on **UI stabilization and feature integration**. I structured and integrated **Plot, Residential, Villa, and Commercial project types** under a common workflow using a step-based design (Documents → Block/Villa Details → Floor Details → Flat Details).

I implemented and refined **dynamic table rendering** based on project type selection, ensuring that each module displays its respective tables without affecting others. Special attention was given to the **Residential flow**, where Block-level, Floor-level, and Flat-level tables were aligned with proper validations and step navigation.

Additionally, I worked extensively on **Upload/View functionality**, including modal-based photo uploads, row-wise file handling, delete functionality, and visual feedback for uploaded files. I also cleaned and standardized the **CSS styling**, removing duplicate rules and ensuring consistent table layouts, modal behavior, buttons, and stepper alignment to match AP RERA portal standards.
