

WORK UPDATE

NAME:D Sri Ramya

DATE :11-2-2026

I focused on understanding the functional and technical requirements of the Extension module within the APRERA application. This involved reviewing the user flow, backend API contracts, validation rules, and database dependencies to ensure proper alignment between frontend and backend systems.

Based on the requirements, I began implementing the OTP-based login system for secure access. The following functionalities were developed:

- PAN number validation using regex to ensure correct format
- API integration for Send OTP functionality
- OTP verification logic with backend validation
- Error handling and success message display
- Session storage implementation to store login response securely
- Conditional UI rendering for OTP input after successful OTP generation

Mobile No.	-
Payment For	-
Registration Amount	₹ 1000.00

Select Payment Gateway :
☐ ICICI BANK ☐ AXIS BANK ☐ HDFC BANK

Total Amount ₹ 1000.00

All UI components were structured according to the government portal layout standards, maintaining consistent styling, alignment, and responsiveness.

Additionally, breadcrumb navigation was implemented as per requirement:

"You are here: Home / Registration / Project Registration / Apply for Project Extension"

The breadcrumb includes:

- Clickable Home navigation
- Yellow underline styling for Home
- Active page highlighted properly
- Consistent government portal theme

This ensures improved user navigation and clarity.

Project Name V
Project ID null
Validity From 08/01/2026
Validity To According to Plans & Proceedings 31/01/2026
Mention New Validity From Date According to Plan and Proceedings dd-mm-yyyy
Mention New Validity To Date According to Plan and Proceedings dd-mm-yyyy

Supporting Documents

1. Representation Letter explaining the reason for delay Choose File No file chosen
2. Form B with revised completion dates Choose File No file chosen

ISSUE IDENTIFICATION & RESOLUTION

During integration testing, several issues were identified and resolved:

1. INNER JOIN Filtering Issue

While fetching project details based on PAN number, some valid project records were not appearing. After analyzing the SQL query, it was identified that the use of INNER JOIN was excluding projects that did not have corresponding entries in the secondary table.

Resolution:

The query was modified to use LEFT JOIN instead of INNER JOIN. This ensured that all valid project records linked to the PAN were returned, even if related secondary table data was missing.

2. Backend Validation Error (Missing Mandatory Field)

An API request failure was identified due to a missing mandatory field (tokenCode) in the frontend payload.

Resolution:

The frontend request payload structure was updated to include the required field as per backend validation requirements. After modification, end-to-end testing confirmed successful API response.

3. OTP Resend & Verification Handling

Improved OTP resend logic to prevent input conflicts and ensure proper state reset before re-requesting OTP.

4. Error Handling Improvements

Enhanced user-friendly error messages for:

- Invalid PAN format
- Incorrect OTP
- API failure responses
- Network errors

These changes improved system reliability and user experience.

UI ENHANCEMENTS & FUNCTIONAL IMPROVEMENTS

Significant improvements were made to enhance usability and maintain consistency with the official portal design:

- Structured layout with outer frame border similar to government site
- Responsive alignment for PAN and OTP fields
- Button state handling (Sending..., Verifying...)
- Popup validation for invalid PAN
- Consistent spacing and typography

- Disabled PAN input after OTP generation
- Proper navigation to ExtensionProcess page with login data

Session management was implemented using sessionStorage to temporarily store login response securely for further processing in the extension workflow.

The complete OTP login flow now works as follows:

1. User enters PAN number
2. PAN format validation is checked
3. OTP is sent to registered email
4. User enters OTP
5. OTP is verified with backend
6. Upon success, user is redirected to Extension Process page

All edge cases were tested, including:

- Invalid PAN
- Invalid OTP
- Expired OTP
- Resend OTP functionality
- Multiple API attempts
