

WORK UPDATE

Name: D Sri Ramya

Date: 7-3-3036

Introduction

I worked on the Quarterly Updates module for Residential projects, specifically the Block, Floor, and Flat sections. I implemented the table structure, added validation logic, and integrated the Save functionality so that when a row is completed and saved, the checkbox shows a green tick similar to the Block step. I also worked on the Upload/View photo modal for each row and handled state management for saving the entered data. Today I will continue refining the row-wise save behavior and validation in the Flat section and ensure the UI flow and save indicators work consistently across all steps.

The Quarterly Updates module is developed to manage and update construction progress details for different project types such as Plot, Villa, Residential, and Commercial. This module allows users to provide periodic updates related to project construction status, sale status, remarks, and upload supporting documents and photos. The system is designed using React for the frontend and is structured in a step-wise workflow to ensure organized data entry.

The application provides a user-friendly interface where users can enter project details, upload documents, and save progress updates. Each section of the application validates user input before allowing the next step. The module is designed to ensure transparency and efficient tracking of project development activities.

The Quarterly Updates system improves project monitoring by allowing administrators to track block-wise, floor-wise, and flat-wise progress. It also supports document uploads and photo evidence for construction progress.

WORK UPDATE

2. System Architecture

The application is built using modern web technologies and follows a component-based architecture.

Frontend Technologies

The frontend of the application is developed using:

- React.js
- JavaScript (ES6)
- HTML5
- CSS3
- React Router

React components are used to manage different sections of the system such as Block Details, Floor Details, Flat Details, and Upload Modules.

Backend Integration

The system is designed to integrate with backend APIs for saving project data and uploading documents. Data is sent using REST APIs with FormData objects.

Example backend endpoint used:

`http://localhost:8080/api/project/quarterly/plot/save`

The backend processes uploaded files and stores project update information in the database.

Database

The system is designed to store information in a relational database such as PostgreSQL. The database maintains records for:

- Project Details
- Block Information
- Floor Information
- Flat Information
- Uploaded Documents
- Construction Status Updates

WORK UPDATE

3. Module Implementation

The Quarterly Updates module is divided into multiple sections based on the project type selected by the user.

Project Type Selection

Users can select the project type from a dropdown menu:

- Plot
- Villa
- Residential
- Commercial

Based on the selected project type, the corresponding table and workflow will appear.

Plot Module

The Plot module allows users to update details for multiple plots.

The table includes the following fields:

- Plot Number
- Construction Status
- Sale Status
- Remarks
- Sale Document Upload
- Upload/View Photos

Users can upload sale documents and construction images to provide proof of progress.

After filling the required information, users can click the **Save** button to store the data. Once saved, the row checkbox will turn **green**, indicating that the record has been successfully stored.

Finally, users can click **Final Submit** to complete the quarterly update.

Villa Module

WORK UPDATE

The Villa module works similarly to the Plot module but tracks villa construction progress.

Each row represents a villa unit and includes the following fields:

- Villa Number
- Construction Status
- Sale Status
- Remarks
- Sale Document Upload
- Upload Photos

Users can upload supporting documents and photos to track construction progress.

When users click the **Save** button, rows containing valid information will be marked with a green checkbox to indicate successful saving.

The **Final Submit** button is used to finalize the quarterly update.

Residential Module

The Residential module is implemented using a step-by-step workflow consisting of three stages:

1. Block Details
2. Floor Details
3. Flat Details

This structured workflow ensures that construction updates are recorded at multiple levels of the project.

Block Details

In the Block Details step, users enter information for each block in the project.

Fields include:

- Block Name
- Construction Status
- Remarks

WORK UPDATE

- Upload Photos

Users can upload block-wise construction photos. When users click the **Submit** button, rows containing valid data will be marked with a green checkbox.
