Quarterly Updates Module – Project Block Villa Details

I completed the implementation of the Quarterly Updates module flow, including the stepper-based navigation for Documents, Block/Villa Details, Floor Details, and Flat Details. I integrated conditional rendering based on project type (Plot and Residential), and ensured the Residential hierarchy (Block → Floor → Flat) works correctly. I also implemented the reusable Upload Photos modal across all levels and connected it properly using props. Additionally, I added the Save and Final Submit buttons at the bottom as per the UI requirement. The module UI and functionality are now working as expected, and it is ready for further backend integration.

The Quarterly Updates Module is developed to manage and update construction progress details for registered projects. This module allows users to update information based on project type such as Plot, Residential, Commercial, and Villa.

The system follows a structured multi-step workflow to ensure proper data entry and organized project tracking.

The screenshot displays the 'Quarterly Updates' interface for a Residential project. At the top, a navigation bar includes links like HOME, ABOUT US, APPEAL, NOTIFICATIONS, REGISTRATION, REPORTS, REGISTERED, JUDGEMENTS/ORDERS, KNOWLEDGE HUB, and LOGIN. A 'Select Language' dropdown and a 'SEARCH RESM PROJECTS' button are also present. The main content area features a progress stepper with four steps: 1. Documents, 2. Block/Villa Details (currently active), 3. Floor Details, and 4. Flat Details. Below the stepper, a 'Project Complete at' dropdown is set to 'Residential'. The core of the interface is a table with five columns: S.No, Block Name, Contribution Status, Remarks, and Upload Photos. The table contains five rows, all with 'Block A' as the block name and 'Yet To Start' as the contribution status. Each row has an 'Enter Remarks' text input and an 'Upload/View' button. At the bottom of the table, there are 'Save' and 'Final Submit' buttons. A footer at the very bottom contains various policy links and social media icons.

S.No	Block Name	Contribution Status	Remarks	Upload Photos
1	Block A	Yet To Start	Enter Remarks	Upload/View
2	Block A	Yet To Start	Enter Remarks	Upload/View
3	Block A	Yet To Start	Enter Remarks	Upload/View
4	Block A	Yet To Start	Enter Remarks	Upload/View
5	Block A	Yet To Start	Enter Remarks	Upload/View

2. Objective

The main objective of this module is:

- To allow users to update quarterly construction progress
- To manage block-level, floor-level, and flat-level information
- To upload supporting documents and images

WORK UPDATE

- To provide Save and Final Submit functionality
- To maintain structured project hierarchy

3. Technology Used

Layer	Technology
Frontend	React JS
Styling	CSS
State Management	React useState
UI Pattern	Component-based architecture
Modal Handling	Conditional Rendering

4. Architecture Overview

The system follows a component-based clean architecture:

- ProjectBlockVillaDetails → Main container
- BlockLevel → Residential Block UI
- FloorLevel → Residential Floor UI
- FlatLevel → Residential Flat UI
- UploadModal → Image upload management

This approach ensures separation of concerns and maintainability.

5	Block A	5	105	Not To Start	Available	Choose File No file chosen Upload	Enter Remarks Update	Upload/View

Functional Flow & Stepper Logic

1. Stepper Flow

The application uses a 4-step workflow:

1. Documents
2. Block/Villa Details
3. Floor Details
4. Flat Details

The active step is controlled using:

```
const [activeStep, setActiveStep] = useState(1);
```

This ensures dynamic UI rendering based on selected step.

2. Project Type Selection

The dropdown allows users to select:

- Plot
- Residential
- Commercial
- Villa

```
const [projectType, setProjectType] = useState("Plot");
```

WORK UPDATE

Based on selected project type:

- Plot → Displays plot table
 - Residential → Displays Block/Floor/Flat hierarchy
 - Commercial → Placeholder
 - Villa → Placeholder
-

3. Conditional Rendering Logic

Example:

```
{projectType === "Residential" && activeStep === 1 && (  
  <BlockLevel openModal={() => setShowModal(true)} />  
)}
```

This ensures:

- Clean UI separation
 - Dynamic content loading
 - No unnecessary table rendering
-

4. Residential Hierarchy Structure

Residential projects follow 3-level structure:

Block Level

Floor Level

Flat Level

Each level includes:

- Construction Status
- Remarks
- Upload Photos
- Sale Status (Flat Level)
- Sale Document Upload (Flat Level)

WORK UPDATE

Upload Modal & File Handling

1. Upload Modal Purpose

The UploadModal component allows:

- Selecting image file
 - Adding multiple files
 - Viewing uploaded files
 - Deleting files
 - Downloading files
-

2. Modal State Handling

```
const [showModal, setShowModal] = useState(false);
```

Modal opens when:

```
onClick={() => setShowModal(true)}
```

Closes when:

```
onClose={() => setShowModal(false)}
```

3. File Management Logic

Files are stored using:

```
const [files, setFiles] = useState([]);
```

Add file:

```
setFiles([...files, file]);
```

Delete file:

```
setFiles(files.filter((_, i) => i !== index));
```

This allows dynamic file list rendering inside modal table.

4. Advantages of Modal-Based Upload

WORK UPDATE

- Prevents page refresh
 - Clean UI experience
 - Reusable upload component
 - Centralized upload logic
 - Improves user interaction
-

Bottom Action Buttons & Submission Flow

1. Save Button

The Save button allows temporary saving of data before final submission.

Purpose:

- Save draft progress
- Avoid data loss
- Allow future editing

UI Class:

`.projectblockvilla-save-btn`

2. Final Submit Button

The Final Submit button indicates completion of quarterly update.

Purpose:

- Lock the submission
- Send data to backend (future integration)
- Mark update as completed

UI Class:

`.projectblockvilla-final-btn`
