

Question: 1. What is the primary purpose of the Domain Name System (DNS)?

- a) To manage database transactions
- b) To map human-friendly domain names to IP addresses
- c) To encrypt network traffic
- d) To establish secure connections

Question: 2. Which of the following best describes the structure of DNS?

- a) Linear
- b) Hierarchical
- c) Flat
- d) Circular

Question: 3. What is the difference between authoritative DNS servers and caching DNS servers?

- a) Authoritative servers store DNS records, while caching servers temporarily store query results.
- b) Authoritative servers are only used for internal networks, while caching servers are for external networks.
- c) Authoritative servers are slower than caching servers.
- d) Authoritative servers cannot handle DNS queries.

Question: 4. Which of the following terms refers to the local DNS that resolves domain names within an organization?

- a) External DNS
- b) Public DNS
- c) Internal DNS
- d) Root DNS

Question: 5. What is a potential vulnerability associated with DNS that can lead to security issues?

- a) Slow response times
- b) DNS spoofing
- c) Lack of domain names
- d) High bandwidth usage

Question: 6. What type of DNS record is primarily used to associate a domain name with an IP address?

- a) MX Record
- b) A Record
- c) CNAME Record
- d) TXT Record

Question: 7. Which DNS record type is responsible for defining the mail servers for a domain?

- a) NS Record
- b) PTR Record
- c) MX Record
- d) SOA Record

Question: 8. What is the purpose of a CNAME record in DNS?

- a) To map a domain to an IP address

- b) To link one domain name to another domain name
- c) To define the authoritative name servers for a domain
- d) To provide text information about a domain

Question: 9. Which DNS record is used for reverse lookups, mapping an IP address back to a domain name?

- a) A Record
- b) PTR Record
- c) SRV Record
- d) TXT Record

Question: 10. What does DNSSEC stand for, and what is its purpose?

- a) Domain Name System Security Extensions; to improve the speed of DNS queries
- b) Domain Name Server Security Engine; to provide redundancy in DNS
- c) Domain Name System Security Extensions; to protect against DNS spoofing
- d) Domain Name System Secure Exchange; to enable encrypted DNS queries

Question: 11. What is the primary purpose of the Network Time Protocol (NTP)?

- a) To manage network traffic
- b) To synchronize device clocks across a network
- c) To secure network connections
- d) To monitor device performance

Question: 12. Why is clock synchronization important in Active Directory environments?

- a) It reduces network latency
- b) It allows for accurate user authentication and log correlation
- c) It enhances the speed of data transfer
- d) It simplifies network configuration

Question: 13. What security protocol is particularly affected by clock skew?

- a) SSL/TLS
- b) Kerberos
- c) IPsec
- d) FTP

Question: 14. In the context of NTP, what is the role of stratum zero devices?

- a) They are the highest level of time sources
- b) They refer to user devices that synchronize with NTP servers
- c) They are atomic clocks that provide the most accurate time
- d) They are routers that distribute time signals

Question: 15. Which of the following best describes the impact of time synchronization on security logs?

- a) It has no impact on security logs
- b) Accurate timestamps are essential for effective log correlation and intrusion detection
- c) It slows down log generation
- d) It complicates log management
