Today, I worked on the healthcare project, developing the hospital bed booking system frontend using React. I implemented General and ICU blocks with dynamic tables to display bed details, added booking modals for managing bed reservations, and created an “Add Ward” feature with modal forms that dynamically generate beds. Additionally, I prepared the frontend for backend integration to fetch and post data, ensuring a responsive layout and clear bed availability indicators.

Added “Add Ward” button for each main block to open a modal form.

Auto-generates beds based on total beds input and updates the grid dynamically.

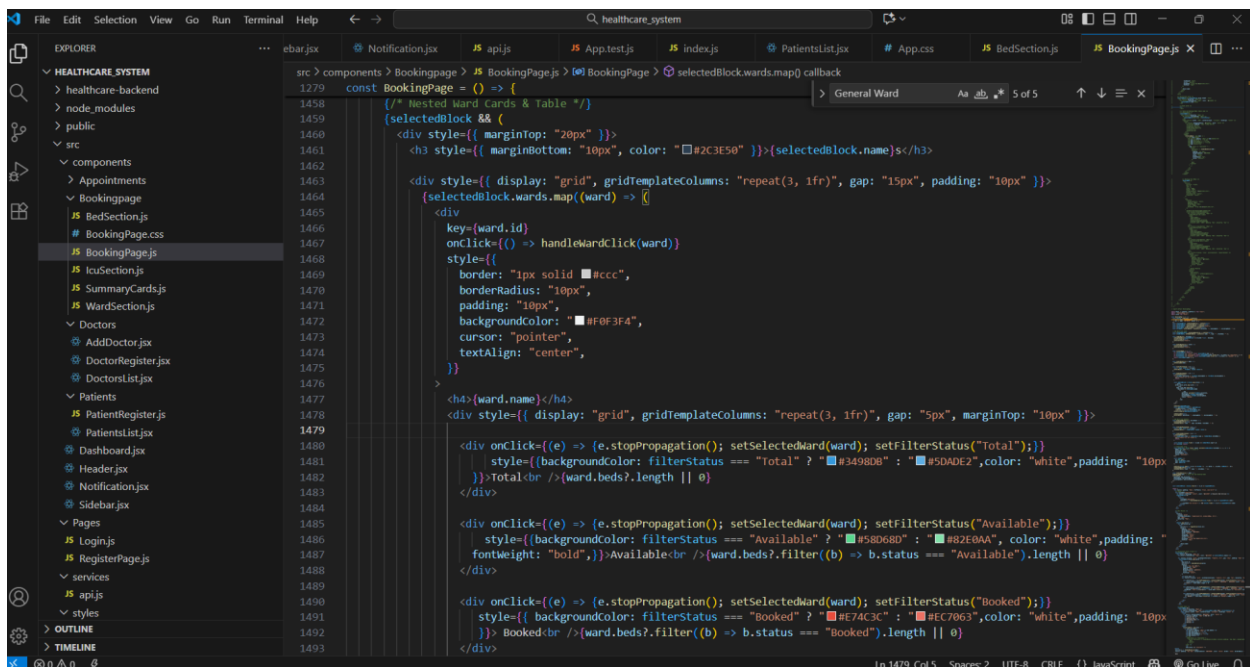

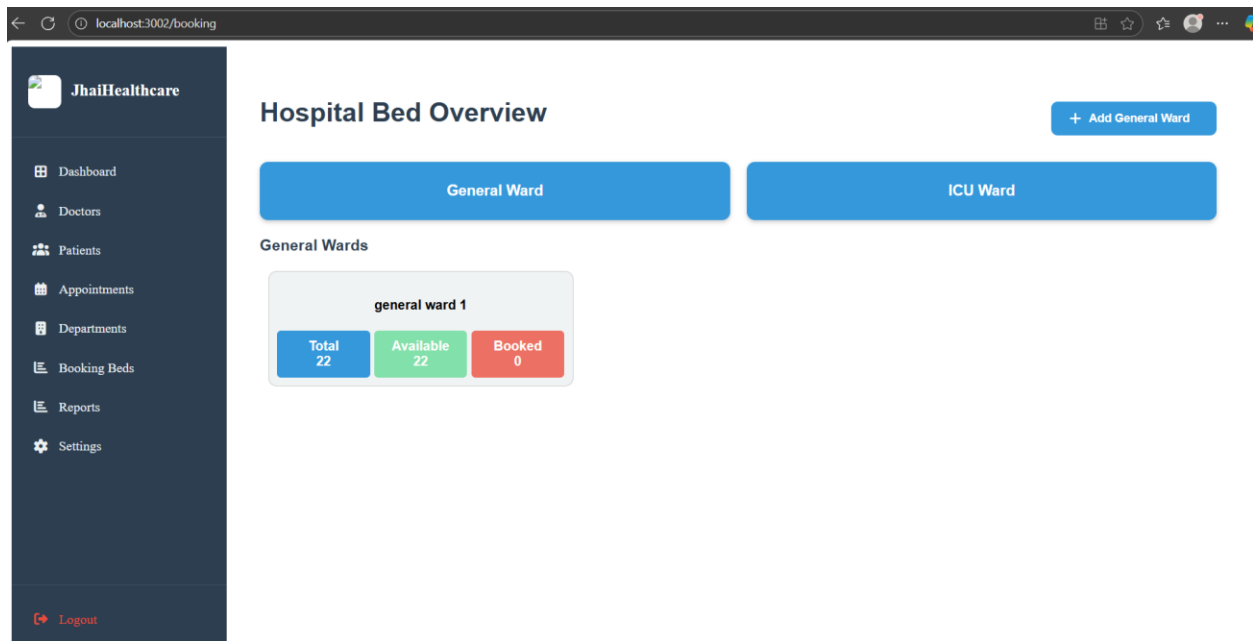

Used useState for blocks, wards, selected ward, booking bed, and form data.

Local state updates reflect bookings and newly added wards immediately.

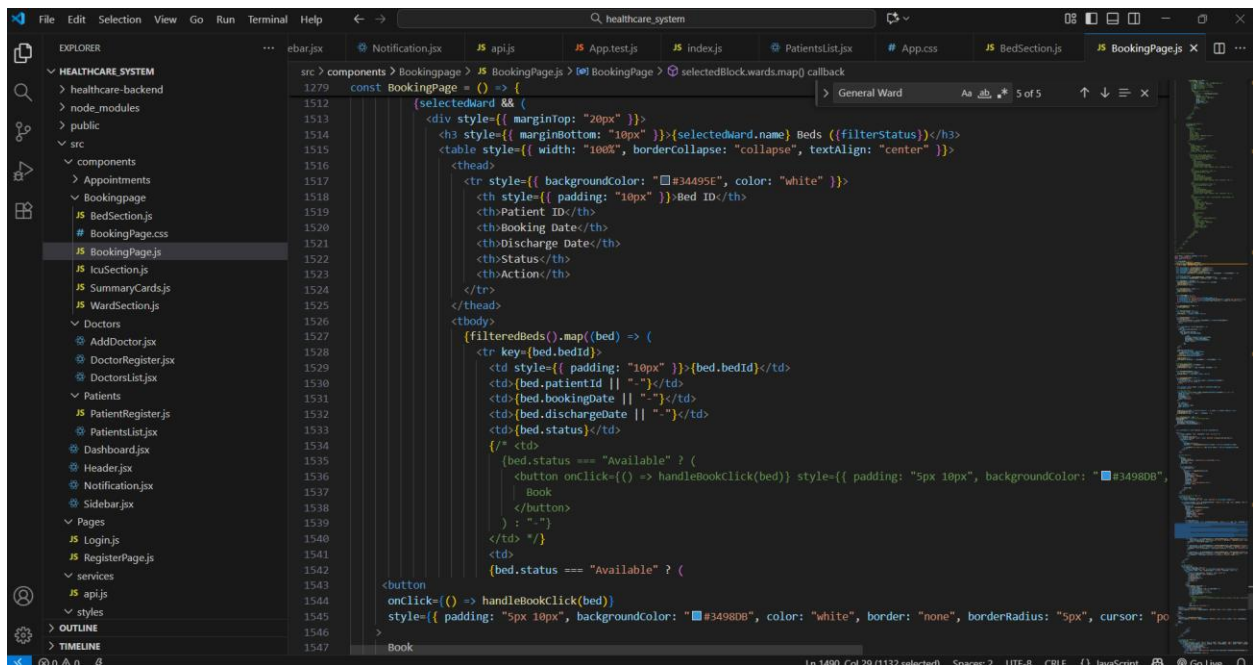

Placeholders for Axios calls to fetch wards and beds from backend.

Bookings and new wards are ready to be posted once APIs are available.

The table shows bed details (Bed ID, Patient ID, Booking Date, Discharge Date, Status) for the selected ward. It updates dynamically with filters, currently using frontend-generated data, with backend fetching ready.
