

Daily Status Report

Name : M. Eswari

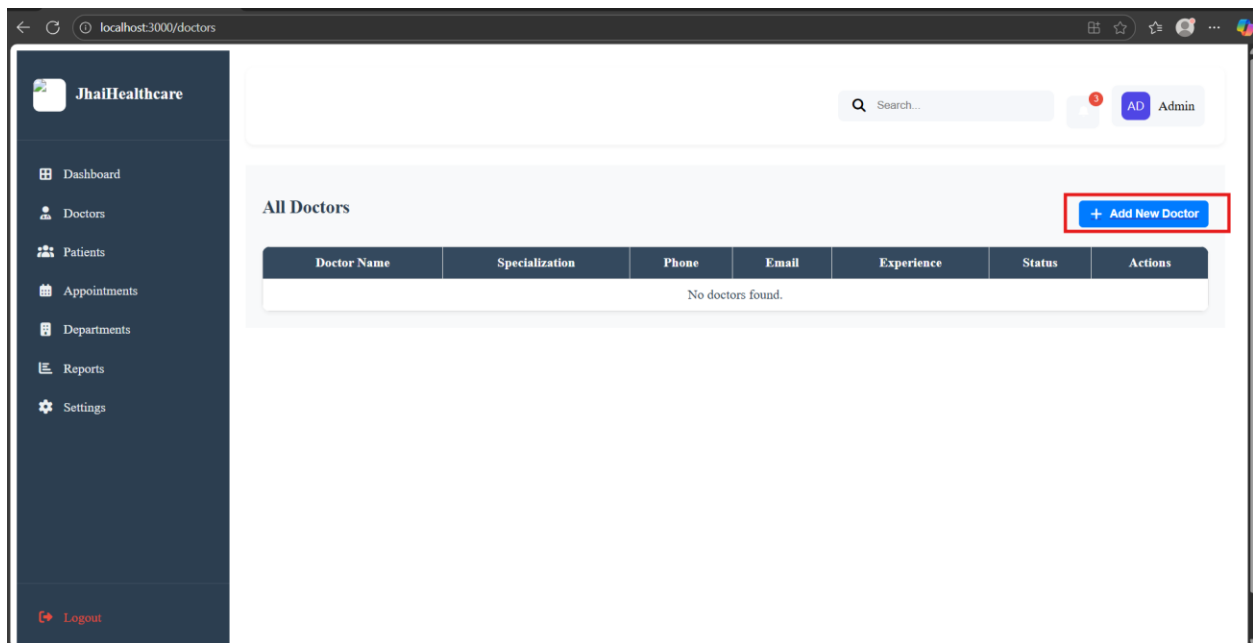

Date : 15-10-2025

Today, I worked on the frontend using React. I developed the Patient List page, the Patient Registration page, and the Doctor Registration page in the Admin Dashboard.

Using this approach makes the form structure clear and easy to read, like normal HTML. It keeps all input fields, dropdowns, and buttons organized, even with many fields. Conditional messages, such as success or error notifications, are simple to display. State management and API calls remain separate, making the code easier to maintain.

```
387 import React, { useState, useRef } from "react";
388 import axios from "axios";
389
390 const DoctorRegister = () => {
391   const genders = ["Male", "Female", "Other"];
392   const specializations = [
393     "Cardiologist", "Dermatologist", "Neurologist", "Pediatrician",
394     "Orthopedic", "General Physician", "Psychiatrist", "Gynecologist",
395     "Dentist", "ENT Specialist",
396   ];
397   const roles = ["Doctor", "Consultant", "Surgeon", "Specialist"];
398   const statuses = ["Active", "Inactive"];
399
400   const [formData, setFormData] = useState({
401     first_name: "", last_name: "", email: "", phone: "",
402     password: "", confirm_password: "", date_of_birth: "", age: "",
403     gender: "", country: "", state: "", city: "", address: "",
404     pin_code: "", specialization: "", qualification: "",
405     experience_years: "", license_number: "", role: "", status: "",
406     profile_photo: null,
407   });
408
409   const [errors, setErrors] = useState({});
410   const [success, setSuccess] = useState("");
411
412   const refs = {
413     first_name: useRef(null), last_name: useRef(null), email: useRef(null),
414     phone: useRef(null), password: useRef(null), confirm_password: useRef(null),
415     date_of_birth: useRef(null), gender: useRef(null), country: useRef(null),
416     state: useRef(null), city: useRef(null), address: useRef(null),
417     pin_code: useRef(null), specialization: useRef(null), qualification: useRef(null),
418     experience_years: useRef(null), license_number: useRef(null), role: useRef(null),
419     status: useRef(null), profile_photo: useRef(null),
420   };
421
422   const handleChange = (e) => {
423     const { name, value, files } = e.target;
```

Created the **Patient List Page** showing Patient Name, Age, Phone, Last Visit, Doctor, Status, and Actions in a table.

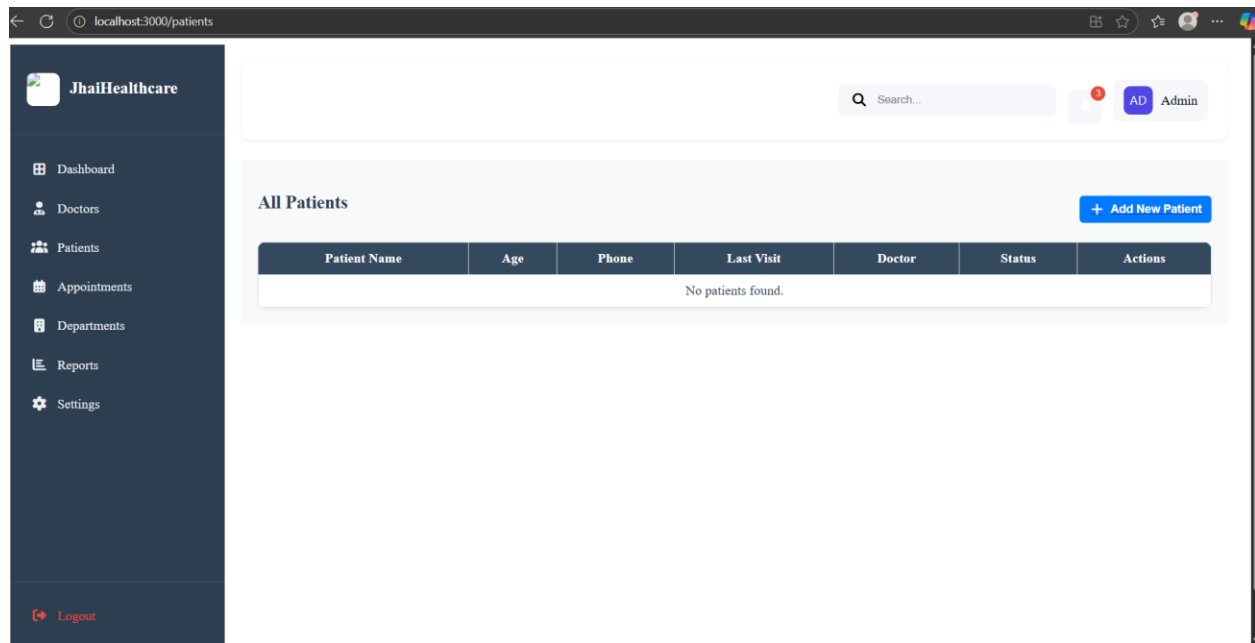

Implemented **dynamic rendering** with React.js and empty state handling.

Styled the table, status badges, and added navigation to the registration page using **React Router**.

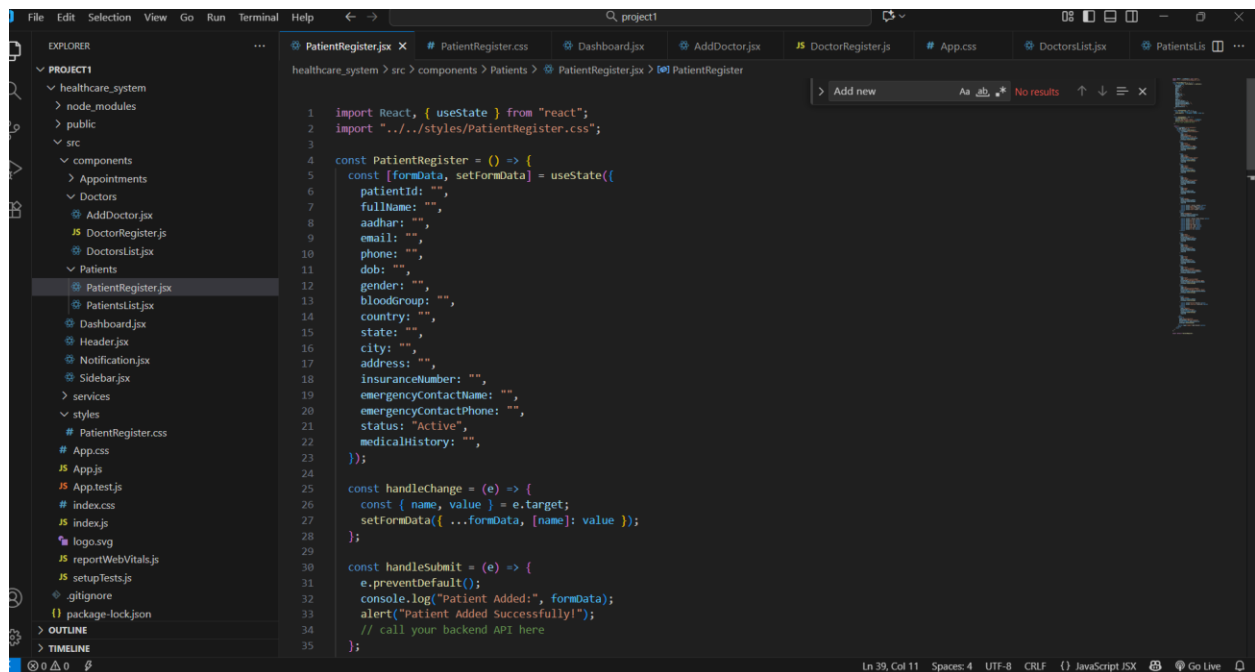

```

58 import React, { useState } from "react";
59 import '@fortawesome/fontawesome-free/css/all.min.css';
60 import { Link } from "react-router-dom";
61
62 const PatientsList = () => {
63   // Empty patient data for now
64   const [patients] = useState([]); // later fetched from backend
65
66   // Action handlers
67   const handleView = (id) => alert("View Patient ID: ${id}");
68   const handleEdit = (id) => alert("Edit Patient ID: ${id}");
69   const handleDelete = (id) => alert("Delete Patient ID: ${id}");
70
71   return (
72     <div className="page-content active">
73       <div className="page-header">
74         <h2>All Patients</h2>
75         <Link to="/patientregister">
76           <button className="btn-add">
77             <i className="fas fa-plus"></i> Add New Patient
78           </button>
79         </Link>
80       </div>
81
82       <div className="table-container">
83         <table className="data-table">
84           <thead>
85             <tr>
86               <th>Patient Name</th>
87               <th>Age</th>
88               <th>Phone</th>
89               <th>Last Visit</th>
90               <th>Doctor</th>
91               <th>Status</th>
92               <th>Actions</th>
93             </tr>
94           </thead>

```

Developed the **Admin Patient Registration Form** with fields like Patient ID, Name, Aadhar, Contact, DOB, Gender, Blood Group, Address, Insurance, Emergency Contact, Status, and Medical History. Handled inputs and submission using **React.js state (useState)**. Designed a **responsive 2-column grid layout** with CSS for better usability.
