

Admin Work Order Management Application

Overview:

The Admin Work Order Management Application is a centralized system designed to manage work orders, contractors, pricing, and workflow approvals in a structured and controlled manner. It ensures proper work configuration, financial validation, contractor verification, and real-time monitoring through notifications.

Main Modules:

1. Setup Module:

This module defines master data such as Work Categories, Work Items, Work Types, Work Descriptions, Maximum Work Order Amount, and Area structure (Region, State, City). It acts as the foundation of the system.

2. Standard Rate Module:

This module allows the admin to create and modify standard rates for each work scope. During work order creation, the system validates financial conditions such as maximum limit and contractor rate comparison to maintain pricing control.

3. Management Module:

Contractors register with personal and professional details. The admin verifies documents and either approves or rejects the contractor. Only approved contractors can receive work orders.

4. Work Orders Module:

The admin creates and assigns work orders manually or automatically. The contractor must accept the work order, execute the work, raise a completion request, and wait for admin verification. After verification, the admin closes the work order.

5. Notifications Module:

The system generates notifications when:

- Work scope reaches maximum limit.
- Work amount is below contractor rate.
- Work is assigned.
- Completion request is raised.
- Work is approved.

Overall Workflow:

1. Admin configures master data.
2. Admin sets standard rates.
3. Contractors register and get approved.
4. Admin creates and assigns work order.
5. Contractor accepts and completes the work.
6. Contractor raises completion request.
7. Admin verifies and closes the work order.

Conclusion:

This application provides structured workflow management, financial control, contractor accountability, and administrative supervision across the complete work order lifecycle.
