

WORK UPDATE

Name : D Sri Ramya

Date : 16-3-2026

In today's work I completed the implementation of the Residential module for quarterly updates, specifically the Block, Floor, and Flat sections. I added validations to ensure all required fields such as status, remarks, and photo uploads are completed before allowing the data to be saved. I also implemented the save functionality with row-level indicators so that once the data is saved successfully the row shows a green tick. Additionally, I worked on the photo upload and view functionality for each row to ensure images are properly attached and displayed. Currently everything is working as expected and I am continuing with further improvements and testing.

Quarterly Project Updates – Block, Floor, and Flat Details Module

1. Introduction

The Quarterly Updates module is designed to capture and maintain the construction and sales progress of a registered project. This module enables project administrators to record detailed information regarding blocks, floors, and flats within the project. The system allows users to enter construction status, sale status, remarks, and upload relevant documents and photos for each unit.

The primary objective of this module is to ensure accurate and structured reporting of project progress during each quarterly update cycle. By maintaining detailed records of construction stages and documentation, the system helps regulatory authorities and stakeholders monitor project development effectively.

WORK UPDATE

The module supports multiple project types including Plot, Villa, Residential, and Commercial projects. Each project type has specific fields and requirements to capture the relevant data. The Residential section particularly focuses on capturing data at three hierarchical levels: Block, Floor, and Flat.

1 Documents 2 Block/Villa Details 3 Floor Details 4 Flat Details

Project Consists of:

	S.No	Plot No	Construction Status	Sale Status	Remarks	Sale Document	Upload Photos	
☐	1	1	Select	Select		Choose File No f...sen	Upload/View	

2. System Overview

The Quarterly Updates system is developed using modern web technologies including React for the front-end interface and API integration for backend data communication. The interface is designed to be user-friendly, ensuring that users can easily input and manage project data.

The module follows a step-based workflow where users move sequentially through the different sections of the update process. These steps include entering block details, floor details, and flat details. Each step includes validation rules to ensure that mandatory information is provided before saving the data.

Users are also required to upload supporting photos and documents to verify the construction status of different units. These uploads provide visual confirmation and documentation for regulatory compliance.

The system ensures that data is only saved when all required fields are filled and the necessary documents are uploaded.

3. Residential Block Details

WORK UPDATE

The Residential Block section captures information about each block within the residential project. This step allows users to enter details such as the block name, construction status, remarks, and upload photos related to the block's construction progress.

Users must select the block name from a dropdown menu and specify the current construction status. The available status options include "Yet To Start", "In Progress", and "Completed". In addition to this, users can enter remarks to provide additional information about the block.

Photo uploads are mandatory in this section. Users must upload at least one photo to verify the current construction stage. The system also displays the number of uploaded photos to confirm successful uploads.

Once all fields are completed and photos are uploaded, the user can click the Save button. The row will then be marked as saved, and a green checkbox will appear indicating successful data entry.

4. Residential Floor Details

The Residential Floor section records the construction details for each floor within a block. This step ensures that the progress of individual floors is tracked separately within the system.

Users must select the block name and the floor number from dropdown lists. The floor construction status must also be selected, and remarks may be entered to provide additional context regarding the construction progress.

Similar to the block section, users are required to upload photos showing the floor's construction progress. These photos serve as verification for the reported status and help maintain transparency in project reporting.

The system validates all entered data before allowing the save operation. If any mandatory field is missing or photos are not uploaded, the system displays an alert message requesting the user to complete the required fields.

After successfully saving the data, the row is marked with a green indicator showing that the floor information has been properly recorded.

5. Residential Flat Details

The Residential Flat section captures detailed information about individual flats within each floor. This section includes fields for block selection, floor selection, flat number, construction status, sale status, remarks, and sale document upload.

WORK UPDATE

Users must provide both construction and sale status for each flat. The construction status indicates the progress of the unit, while the sale status shows whether the flat is sold or available. Remarks can be added to provide additional information if necessary.

In addition to the status fields, users must upload sale documents and construction photos where applicable. These documents help verify the legal and operational status of the flat.

The system performs strict validation checks to ensure that all required data is entered before allowing the save operation. If any required field is missing, the system prompts the user to complete the information.

Once saved, the system visually confirms the saved data with a green checkbox, indicating that the flat details have been successfully recorded.

6. Conclusion

The Quarterly Updates module plays a crucial role in maintaining transparency and accountability in project development reporting. By capturing detailed information at the block, floor, and flat levels, the system ensures that construction progress is accurately documented and monitored.

The integration of validation rules and mandatory photo uploads ensures that all reported data is supported by evidence. This helps regulatory authorities verify the project status and ensures compliance with reporting standards.

Overall, the system provides an efficient and structured approach to recording quarterly project updates, improving data accuracy and simplifying the monitoring process for both project administrators and regulatory bodies.
