

WORK UPDATE

Name : D Sri Ramya

Date : 23-2-2026

Today I worked on the Project Closure module where I implemented supporting documents upload functionality with mandatory field validation. I added PDF-only file validation using a common handler and displayed error messages when invalid files are uploaded. I also updated the UI to include red star marks for required fields and ensured conditional rendering for the occupancy certificate upload. Currently, the frontend is working as expected, and next I will focus on improving validation and integrating further backend checks.

The Project Closure Module is designed to facilitate the final stage of a project lifecycle by enabling promoters to submit required closure details along with supporting documents. This module ensures that all mandatory documents are uploaded correctly before submission, improving data accuracy and compliance with regulatory requirements.

The system captures essential project details such as Application Number, Project Name, and Promoter Name. These details are pre-filled and displayed in a read-only format to avoid manual errors. The module also includes a structured section for uploading supporting documents required for project closure.

The main objective of this module is to provide a user-friendly interface while enforcing strict validation rules to ensure only valid and required documents are submitted.

Features of the Module

WORK UPDATE

The Project Closure Module includes the following key features:

- **Auto-Fetch Project Details**
Project details are fetched from navigation state or local storage and displayed in read-only fields.
- **Occupancy Certificate Selection**
Users can select whether they have an Occupancy Certificate using radio buttons. Based on the selection, the upload field is conditionally displayed.

Promoters Corner

Real Estate Agent Corner

Complaint Corner

- **Supporting Documents Upload Section**
The form includes multiple document upload fields such as:
 - Sale Deed Copies
 - Association of Allottees
 - Common Areas Handover Proof
 - Structural Liability Affidavits (F6, F7)
 - Bank Statement
 - Project Photographs
- **Mandatory Field Indication**
All required fields are marked with a red star (*) for better clarity.
- **Form Submission**
Data is submitted using a POST API call along with file uploads using FormData.

Validation Implementation

WORK UPDATE

To ensure data integrity, file validation has been implemented in the module.

PDF File Restriction

All document uploads (except photos) are restricted to PDF format using:

- `accept=".pdf"` attribute
- Custom validation function

Validation Logic

A function `handleFileChange` checks the file type:

- If the file is not PDF:
 - The file input is cleared
 - Error message is displayed:
"Please upload only PDF format"
- If the file is valid:
 - Error message is removed

Error Display

Error messages are shown below the respective input field in red color for better user visibility.

This ensures that only valid documents are uploaded, reducing backend errors.

UI Design and User Experience

The UI is designed to be clean, structured, and user-friendly.

Layout Design

- The form is placed inside a card layout with shadow and border
- Sections are clearly divided using headings
- Labels and inputs are aligned using grid layout

Styling Features

- Blue section headers for clarity
- Styled file input buttons
- Red color for mandatory fields and error messages

WORK UPDATE

- Responsive spacing and alignment

User Experience Enhancements

- Conditional rendering for Occupancy Certificate upload
- Instant validation feedback
- Clear indication of required fields

These enhancements improve usability and reduce user errors.

Conclusion

The Project Closure Module successfully integrates frontend validation, structured UI design, and backend integration to ensure smooth project closure submissions.

By enforcing mandatory fields and restricting file formats to PDF, the system ensures high data quality and compliance with standards. The use of React state management and conditional rendering improves the dynamic behavior of the form.

Overall, the module provides a robust and efficient solution for handling project closure requirements, making it reliable and user-friendly.

Future improvements may include:

- Field-specific error handling
- File upload preview or success indicators
- Enhanced validation with file size limits
