

WORK UPDATE

Name: D Sri Ramya

Date:5-02-2026

Today I worked on the Quarterly Updates module in the Residential section. I implemented the Block, Floor, and Flat components with step-wise navigation. I also added save functionality for each step and implemented checkbox validation so that rows turn green after successful save. Additionally, I worked on the Upload/View photo modal and integrated file upload handling for blocks, floors, and flats. Today I will continue refining the functionality, fix any remaining issues, and ensure the data flow works correctly across all residential steps.

Quarterly Updates Module – Implementation Document

1. Introduction

The Quarterly Updates module is developed to allow users to provide periodic updates about the progress of a registered project. This module helps in maintaining the construction progress and sales status of different types of projects such as Plot, Villa, Residential, and Commercial projects.

The system provides a structured way for the user to input details related to block construction, floor construction, flat status, and also allows uploading related documents and photos. The module is designed using React and follows a step-by-step workflow so that users can easily update information for each part of the project.

The primary objective of this module is to ensure accurate tracking of construction progress and maintain proper documentation through uploaded files and images. The interface is designed in a user-friendly manner so that the user can easily navigate between different steps of the quarterly update process.

WORK UPDATE

The screenshot shows a web interface for 'Quarterly Updates'. At the top, a breadcrumb trail reads 'You are here: Project Registration / Existing Project / Quarterly Updates'. Below this, the title 'Quarterly Updates' is displayed next to a 'Back to Dashboard' button. A progress bar with four steps is shown: 1. Documents, 2. Block/Villa Details (currently active), 3. Floor Details, and 4. Flat Details. Below the progress bar, a dropdown menu labeled 'Project Consists of:' is set to 'Residential'. The main section is a table with columns: S.No, Block Name, Construction Status, Remarks, and Upload Photos. The table contains three rows. The first row is for 'Block A' with status 'In Progress' and a checked checkbox. The second and third rows are for 'Select Block' with status 'Select' and unchecked checkboxes. Each row has an 'Upload/View' button. At the bottom right, there are 'Submit' and 'Next' buttons.

S.No	Block Name	Construction Status	Remarks	Upload Photos
1	Block A	In Progress	hi	Upload/View
2	Select Block	Select		Upload/View
3	Select Block	Select		Upload/View

2. Technologies Used

The Quarterly Updates module is developed using modern frontend technologies to ensure scalability and maintainability.

React JS

React is used as the primary frontend framework to build reusable components and manage the user interface efficiently. React's component-based architecture helps in organizing the code into manageable parts such as Residential Block, Floor, and Flat components.

React Hooks

React hooks such as `useState` are used to manage component state. These hooks help in storing and updating data such as block details, floor details, flat information, uploaded files, and step navigation.

React Router

React Router is used for navigation between different sections of the application. The `useNavigate` hook is used to redirect users to other pages such as the Project Registration Wizard.

CSS

Custom CSS styling is used to design the tables, buttons, modal windows, and layout elements. The styles help maintain a consistent visual appearance throughout the module.

Backend API Integration

WORK UPDATE

The system is designed to integrate with backend APIs using fetch. The data entered by the user is collected and sent to the backend server in the form of FormData, including file uploads.

	S.No	Block	Floor	Status	Remarks	Upload Photos
☒	1	hshah	ss	In Progress	ssnn	Upload/View
☐	2			Select		Upload/View
☐	3			Select		Upload/View
☐	4			Select		Upload/View
☐	5			Select		Upload/View

3. Module Workflow

The Quarterly Updates module follows a structured workflow consisting of multiple steps. Each step allows the user to enter specific project information.

Step 1: Block Details

In the first step, the user provides details related to project blocks. The system displays a table containing block rows with fields such as:

- Block Name
- Construction Status
- Remarks
- Upload Photos

Each row includes a checkbox that allows the user to select the block. The user can enter the construction status and remarks for each block.

Once the required information is filled, the user can click the **Save** button to store the data. After saving, the checkbox changes color to indicate that the row has been successfully saved.

WORK UPDATE

	S.No	Block	Floor	Flat	Status	Upload Photos
☒	1	dabbdd	wvfh	100	Completed	Upload/View
☐	2			101	Yet To Start	Upload/View
☐	3			102	Yet To Start	Upload/View
☐	4			103	Yet To Start	Upload/View
☐	5			104	Yet To Start	Upload/View

Step 2: Floor Details

After completing the block step, the user moves to the floor details section. This step captures floor-wise information for the selected block.

The floor table includes the following fields:

- Block Name
- Floor Number
- Construction Status
- Remarks
- Upload Photos

The user can update construction progress for each floor and add remarks related to the floor construction. Similar to the block step, the user must select the checkbox before saving the row.

The **Save** button validates the input fields and updates the saved rows accordingly.

Step 3: Flat Details

The final step captures information about flats present on each floor. The system displays a table containing flat information with fields such as:

- Block Name
- Floor Number
- Flat Number

WORK UPDATE

- Construction Status
- Sale Status
- Remarks
- Sale Document Upload
- Upload Photos

Users can enter the current construction stage of the flat and specify whether the flat is available, sold, or booked.

Additionally, the user can upload sales documents and images related to the flat.

Once the details are filled, the user can click the **Save** button to store the information.

4. File Upload and Photo Management

The module supports uploading both documents and photos. This feature allows users to attach supporting evidence related to construction progress.

Photo Upload

Users can upload photos through a modal window that opens when the **Upload/View** option is clicked.

The modal includes the following features:

- File selection input
- Add button to upload photos
- Table displaying uploaded files
- Download option
- Delete option

Once a file is added, it appears in the table with options to download or delete it.

Sale Document Upload

The module also allows uploading sale documents for flats. The document upload feature includes:

- File selection input
- Upload button

WORK UPDATE

- Display of uploaded file name

Once the file is uploaded successfully, the file name appears below the upload section.

5. Data Saving and Validation

The system includes validation logic to ensure that all required fields are filled before saving data.

Block Save Logic

When the user clicks the Save button in the block section, the system checks whether:

- Construction status is selected
- Remarks are entered

If the required fields are present, the row is marked as saved.

Floor Save Logic

For floor rows, the system validates:

- Checkbox selection
- Construction status
- Remarks

If validation passes, the row is marked as saved.

Flat Save Logic

Flat rows require the following fields before saving:

- Block name
- Floor number
- Construction status
- Sale status
- Remarks

If any required field is missing, the system displays an alert message asking the user to complete the required fields.

6. Project Type Handling

WORK UPDATE

The module supports different project types through a dropdown selection. The user can choose from:

- Plot
- Villa
- Residential
- Commercial

Depending on the selected project type, the system dynamically displays the corresponding table structure.

For example:

Plot projects display plot numbers and construction status.

Villa projects display villa numbers with construction and sale status.

Residential projects display a multi-step process involving block, floor, and flat information.

Commercial projects include block-wise and floor-wise updates.

This dynamic rendering ensures flexibility and supports multiple project configurations within a single module.
