Quarterly Updates Module – Block, Floor & Flat Details

I worked on the Quarterly Updates module in the Residential section. I implemented the Block, Floor, and Flat tables and integrated dropdown selections for Block and Floor similar to the Block module. I also ensured the existing functionality was preserved while modifying the code to support the required dropdown structure. Additionally, I worked on save functionality, checkbox status indicators, and upload/view photo features for each row. Today I will continue refining the module, test the dropdown functionality across all steps, and start preparing the backend integration for storing the block, floor, and flat data.

The **Quarterly Updates Module** is developed as part of the **Project Registration System** to capture and manage construction progress details of different project types such as Plot, Villa, Residential, and Commercial.

This module allows the user to update project progress in a structured way using multiple steps. The system captures important information like **construction status, remarks, uploaded documents, and images** for each block, floor, or flat.

The main objective of this module is to enable developers to provide quarterly updates regarding the construction status of their projects in compliance with regulatory requirements.

The application is developed using the following technologies:

- **Frontend:** React.js
- **Styling:** CSS
- **Navigation:** React Router
- **State Management:** React Hooks (useState)
- **Backend Integration:** API calls using Fetch

The module follows a **step-based workflow**, ensuring that the user enters project data in a structured sequence.

2. System Architecture

WORK UPDATE

The system is designed using a **component-based architecture** in React. Each step of the quarterly update process is implemented as a separate component to maintain modularity and readability.

The main components used in this module include:

The screenshot shows the 'Quarterly Updates' interface. At the top, there's a navigation bar with links like HOME, ABOUT US, APPRAISAL, NOTIFICATIONS, REGISTRATION, REPORTS, REGISTERED, ADJUDICATIONS, KNOWLEDGE HUB, and LOGIN. A language selector and a 'SEARCH RERA PROJECTS' button are also present. The main heading is 'Quarterly Updates' with a 'Back to Dashboard' button. A progress bar indicates four steps: 1. Documents, 2. Block/Flat Details (active), 3. Floor Details, and 4. Flat Details. Below the progress bar, there's a dropdown for 'Project Consists of:' with 'Residential' selected. The main section is a table with 5 rows for blocks. The table headers are: S.No, Block, Floor, Status, Remarks, and Upload Photos. The table is currently empty, showing only the headers. At the bottom right, there are 'Submit' and 'Reset' buttons.

1. ResidentialBlock Component

This component is responsible for capturing **block-level information** of a residential project.

Fields included in this module:

- Block Name (Dropdown)
- Construction Status
- Remarks
- Upload Photos

Users can select the block from a dropdown list and update its construction status. Each row also allows uploading photos related to that block.

2. ResidentialFloor Component

This component captures **floor-wise information** for residential projects.

Fields included:

- Block Name
- Floor Number
- Construction Status

WORK UPDATE

- Remarks
- Upload Photos

Users can select both the block and floor using dropdowns and update the construction status for each floor.

3. ResidentialFlat Component

This component records **flat-wise information** within each floor.

Fields included:

- Block Name
- Floor Number
- Flat Number
- Construction Status
- Sale Status
- Remarks
- Sale Document Upload
- Photo Upload

Each flat entry allows users to upload supporting documents and photos related to construction progress.

You are here: [Project Dashboard](#) / [Existing Project](#) / [Quarterly Updates](#)

Quarterly Updates

[Back to Dashboard](#)

1 Documents 2 Block/Villa Details 3 Floor Details 4 Flat Details

Project Consists of: Residential

S.No	Block	Floor	Status	Remarks	Upload Photos
1	Block B	2	Not To Start		Upload Photo
2	Select Block	Select Floor	Select		Upload Photo
3	Select Block	Select Floor	Select		Upload Photo
4	Select Block	Select Floor	Select		Upload Photo
5	Select Block	Select Floor	Select		Upload Photo

[Save](#) [Next](#)

3. Functional Workflow

WORK UPDATE

The system follows a **step-by-step workflow** using a stepper component.

Step 1: Documents

Users upload required project-related documents.

Step 2: Block / Villa Details

Users enter block-level information such as construction status and remarks.

Step 3: Floor Details

Users provide floor-wise construction status and upload related images.

Step 4: Flat Details

Users provide detailed information about each flat including sale status and documentation.

The stepper helps guide the user through the process and ensures that all required information is entered before final submission.

4. Key Features Implemented

1. Dynamic Table Structure

The module uses dynamic tables where rows are generated automatically based on project requirements.

Example:

Block Table

Floor Table

Flat Table

Each row represents a unit such as block, floor, or flat.

2. Dropdown Selection

Dropdowns are used for selecting important values such as:

- Block Name
- Floor Number
- Construction Status
- Sale Status

Example dropdown values:

WORK UPDATE

Select Block

Block A

Block B

Block C

Select Floor

1

2

3

4

5

This improves data consistency and prevents incorrect manual inputs.

3. Photo Upload System

Users can upload images related to construction progress.

Features implemented:

- Upload photo
- View uploaded photo
- Download photo
- Delete photo

Uploaded photos are displayed in a modal popup with a table structure showing:

- Serial Number
 - Uploaded File
 - Action (Download/Delete)
-

4. File Upload for Sale Documents

Each flat can include a **sale document upload**.

Steps:

1. Select file
2. Click upload
3. File name appears in the interface

WORK UPDATE

This ensures supporting documents are properly stored and tracked.

5. Checkbox Status Indicators

Checkboxes are used to indicate row status.

Colors used:

- **Blue Checkbox** → Row selected
- **Green Checkbox** → Row saved successfully

This visual feedback helps users easily identify completed entries.

5. Data Management

Data within the module is managed using **React state management**.

Main states used in the system:

blockData
floorData
flatData
villaData
tableData

These states store user inputs and update dynamically when users modify values in tables.

Example structure of floor data:

```
{  
  block: "",  
  floor: "",  
  status: "",  
  remarks: "",  
  file: null,  
  uploaded: false,  
  checked: false,  
  saved: false  
}
```

The system updates state using the **setState functions** provided by React.

WORK UPDATE

6. Save and Submit Functionality

The module provides two major actions:

Save

The save function stores user inputs locally and marks completed rows.

Example logic:

```
if(row.block && row.floor && row.status){  
  row.saved = true  
}
```

When saved successfully:

- Checkbox becomes green
 - Row is marked as completed
-

Final Submit

After completing all steps, users can submit the quarterly update.

Submission process:

1. Data is collected from all tables
2. Converted into JSON format
3. Sent to backend API

Example API call:

POST /api/project/quarterly/update

Uploaded files and images are sent using **FormData**.

7. Advantages of the System

The developed system provides several benefits:

- Structured data entry using step-by-step workflow
- Improved accuracy using dropdown selections
- Efficient file and image management
- Easy tracking of construction progress

WORK UPDATE

- User-friendly interface

The modular design also allows easy extension for future features.
