

WORK UPDATE

Name : D Sri Ramya

Date : 26-3-2026

Today, I worked on the Complaint Status module where I implemented form validation and navigation to a separate result page using React Router. On clicking the Check Status button, the user is redirected to a new page where complaint details are displayed in a table format. I also updated the UI to make it more structured and user-friendly by showing key fields like complaint ID, complaint type, status, and number of hearings. Currently, I am working with dummy data, and next I will focus on integrating the backend API for dynamic data fetching.

The Complaint Status Module is developed to allow users to check the status of their complaints in a simple and efficient way. This feature is part of the AP RERA-based application where users can enter complaint details such as complaint type, complaint ID, and CAPTCHA to retrieve the status.

The main objective of this module is to improve user experience by providing real-time complaint tracking. Instead of manually searching or contacting support, users can directly view their complaint details through a structured interface.

This module consists of two main pages:

- Complaint Status Form Page
- Complaint Result Page

The system ensures proper validation before processing user input and displays relevant complaint details in a clean and organized format.

Functionality

WORK UPDATE

The module works in the following steps:

1. The user enters:
 - Complaint Type
 - Complaint ID
 - CAPTCHA
2. Validation is performed:
 - Checks if all fields are filled
 - Verifies CAPTCHA

3. On clicking "**Check Status**":
 - Data is processed
 - User is navigated to the result page
4. The result page displays:
 - Complaint ID
 - Complaint Name (Type)
 - Status
 - Number of Hearings

The navigation between pages is implemented using **React Router (useNavigate)**, ensuring a smooth transition without page reload.

UI Implementation

The UI is designed to be simple and user-friendly.

Complaint Form Page:

WORK UPDATE

- Clean layout with labels and input fields
- Dropdown for complaint type
- CAPTCHA display and input
- Error messages shown below fields

The screenshot shows a web application interface with a dark red navigation bar at the top containing links: HOME, ABOUT US, NOTIFICATIONS, REGISTRATION, REPORTS, REGISTERED, JUDGEMENTS/ORDERS, KNOWLEDGE HUB, LOGIN, and APREAT. Below the navigation bar is a light blue box titled "Complaint Status". Inside this box, there are three input fields: "Complaint Type" with a dropdown menu showing "-- Select Type --", "Complaint ID" with a text input field, and "CAPTCHA" with a text input field. A black CAPTCHA box displaying "A 7 B 9 X" is positioned above the CAPTCHA input field. At the bottom of the light blue box is a blue button labeled "Check Status".

Result Page:

- Data displayed in **table format (horizontal layout)**
- Columns include:
 - Complaint ID
 - Complaint Name
 - Status
 - No. of Hearings

The table format improves readability and matches government-style layouts.

Styling:

- CSS used for layout and spacing
- Table headers styled with background color
- Status highlighted for visibility

Conclusion & Future Enhancements

The Complaint Status Module successfully provides a structured way for users to check complaint details. It improves usability, reduces manual effort, and ensures better data visibility.

Key Achievements:

WORK UPDATE

- Form validation implemented
- Page navigation using React Router
- Dynamic data rendering using state
- Clean table UI for results

Future Enhancements:

- Integration with real backend API
- Display multiple complaint records
- Add filtering and search options
- Include hearing history and timeline
- Download complaint report as PDF

This module can be further enhanced to match full AP RERA functionality with real-time data.
